<section-header>

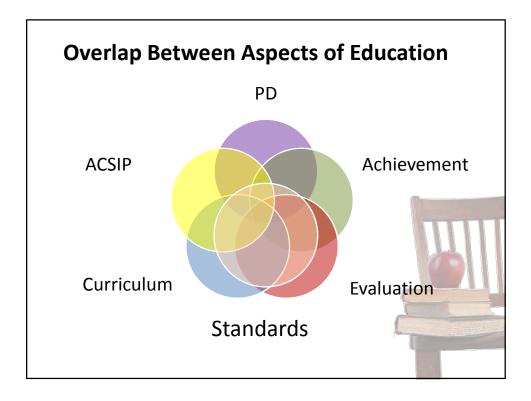

Research on Effectiveness of PD Research clearly indicates that teaching is the strongest predictor of student achievement within the control of school officials. Landmark meta-analyses and systematic narrative reviews have shown that effective PD programs enhance knowledge and skills of teachers and achievement gains of students. Criticisms found in the literature of PD as an effective program to improve instruction and student performance appears to have arisen from 3 primary sources: Scarcity of rigorous scientific studies. Generalizing from the large volume of studies showing that single-shot workshops are ineffective in improving teaching or student performance. **4** Finally, critics often do not differentiate between PD activities that have different purposes. For example, child maltreatment and teen suicide awareness and prevention are important to professional development of teachers, but they are not aimed at enhancing student achievement. Despite these criticisms, the preponderance of evidence from rigorous research indicates that systematically designed, well-executed, PD programs, comprised of key components, are effective in both enhancing the quality of instruction and increasing student achievement gains.

Research on the Effectiveness of PD Vital components in providing effective PD include strong commitment to success of the program, and fidelity of implementation, monitoring, evaluation, and modifications. Goals of PD need to be clearly focused on both acquiring comprehensive knowledge of content and pedagogical skills that can stimulate learning among diverse students. Learning content and skills is a developmental process comprised of sequential steps that need to be tailored to particular needs of individual teachers. PD also should be clearly linked to other aspects of education, such as curriculum and professional evaluation. Research indicates that the most effective means of professional learning involves job-embedded modeling, coaching, classroom observation and feedback, collegial collaboration, and teamwork. 03/15/2016

Research on the Effectiveness of PD

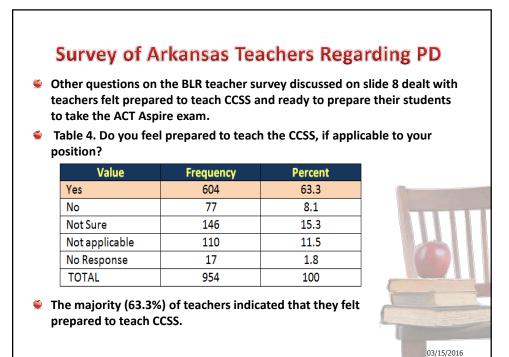

- SCOPE researchers concluded, "The intensity and duration of professional development offered to U.S. teachers is not at the level that research suggests is necessary to have noticeable impacts on instruction and student learning." They noted, "....research suggests that professional development of 14 hours or less has no effect on student learning, while longer-duration programs show positive and significant effects on student achievement."
- In a recent rigorous study of 135 randomly selected schools from five states, researchers at Harvard's Center for Education Policy Research found that the frequency and specificity of feedback from classroom observations, and the number of PD days, were significantly related to student achievement in math, after statistically controlling for student characteristics and prior achievement, and teachers' value-added performance in the previous year.
- In this study, teachers reported having spent an average of 4.5 days in formal PD on Common Core State Standards (CCSS) during the previous year (2013-14).
- The table on the next slide shows the percentage of time teachers spent in various PD activities focused on CCSS.
