| Other Cancers | 4,746 | 36% | \$112,104,525 | 68% | \$2,036 | 1.9x | NA | NA |

Observations

- 13,313 members are diagnosed with cancer, which is favorable when compared to the norm of 9.8%.
- Oncology make up 21.1% of the total plan spend, with PMPM cost that is 2.9 times costlier than the PMPM cost of the total population.
- Members with skin cancer make up 45% of all cancer patients followed by breast cancer with 20% of all cancer patients.
- Lung cancer, while reflecting 4% of all cancer patients, is the costliest of the top 5 on a PMPM basis.

¹ Based on SHAPE (Segal's internal data warehouse) book-of-business.

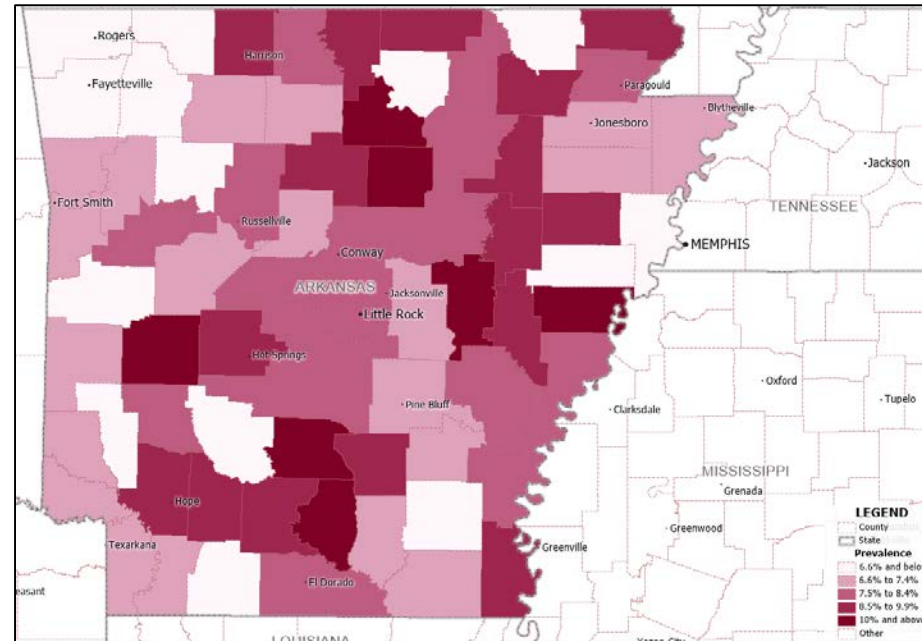

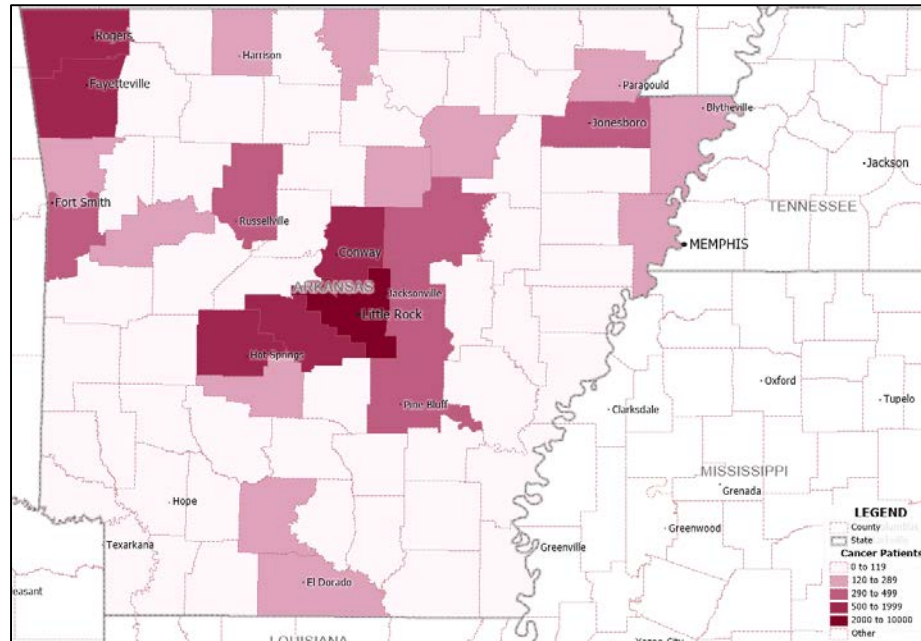

² Reflects the ratio of PMPM costs of members with oncology to the PMPM of the total enrolled population.

³ Reflects the ratio of PMPM costs of members with the specific type of cancer to the overall oncology PMPM

⁴ Refer to appendix for details on preventive screening.

Spotlight On: Oncology (Member Geo-Mapping)

All Members

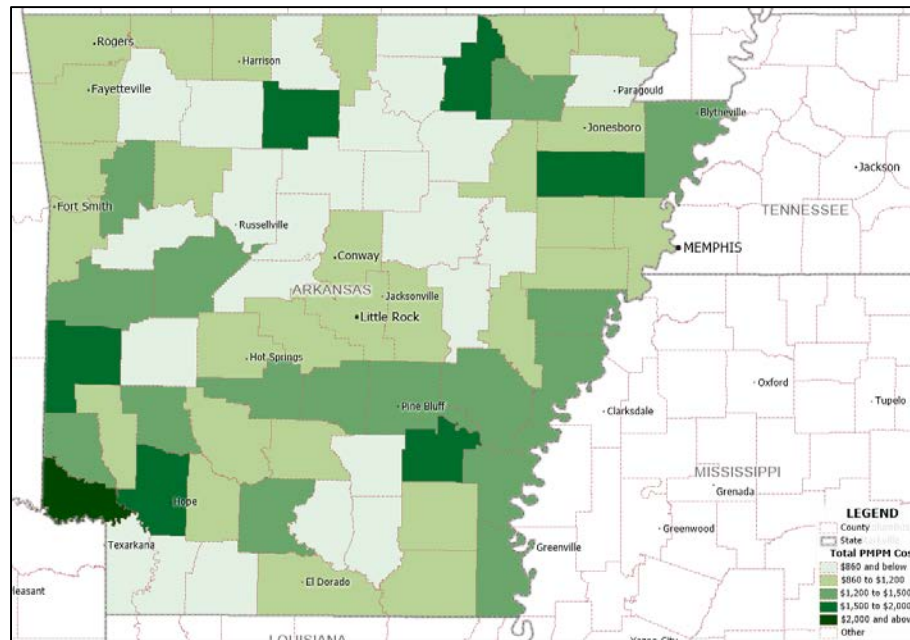

Observations

- The top left map illustrates the distribution of cancer patients by county. The darker red indicating higher patient counts
- The top right map reflects the prevalence of cancer patients compared to total membership in each county. The darker red indicating higher prevalence.

Spotlight On: Oncology (Cost Geo-Mapping)

All Members

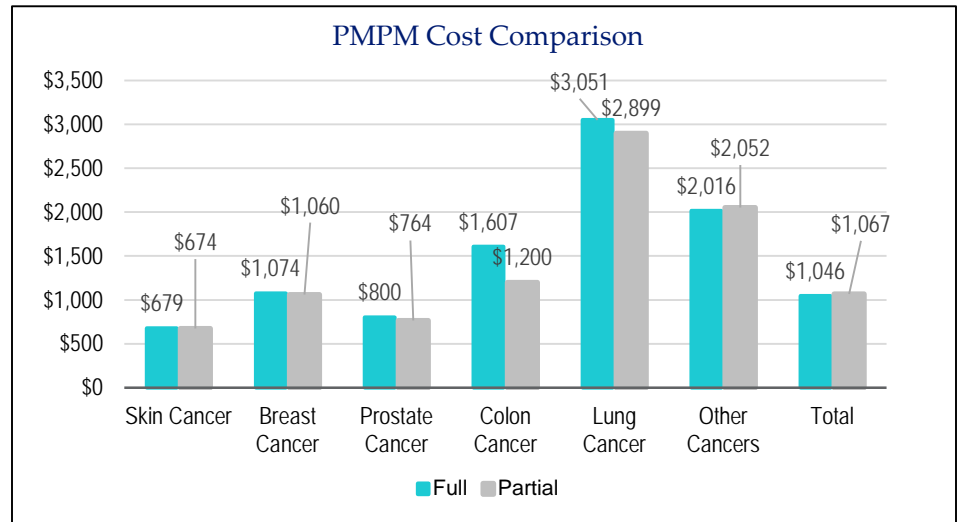

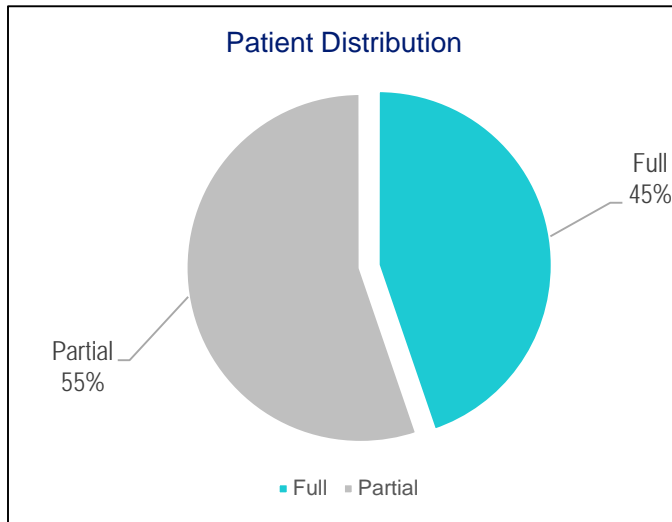

Observations

- The top left map illustrates the PMPM cost of cancer patients by county. The darker green indicating PMPM costs.
- The top right map reflects the relative PMPM cost of cancer patients compared to total PMPM cost of the respective. The darker blue indicating higher cost ratio.

Key Takeaways From Oncology Review

1. Communicate and incentivize age/gender specific cancer screenings
2. Enhance utilization management programs that require adherence to national standards of oncology care (NCCN Guidelines and appropriate genetic testing)
3. Connect oncology patients to nationally recognized Oncology Centers of Excellence (COE) virtually
4. Established vendor partnerships exist within different carriers and independent cancer care centers can offer virtual consultation

For the purposes of this analysis, Grant county— an untagged county by HRSA - was designated as partially underserved.

Key Takeaways From Musculoskeletal Review

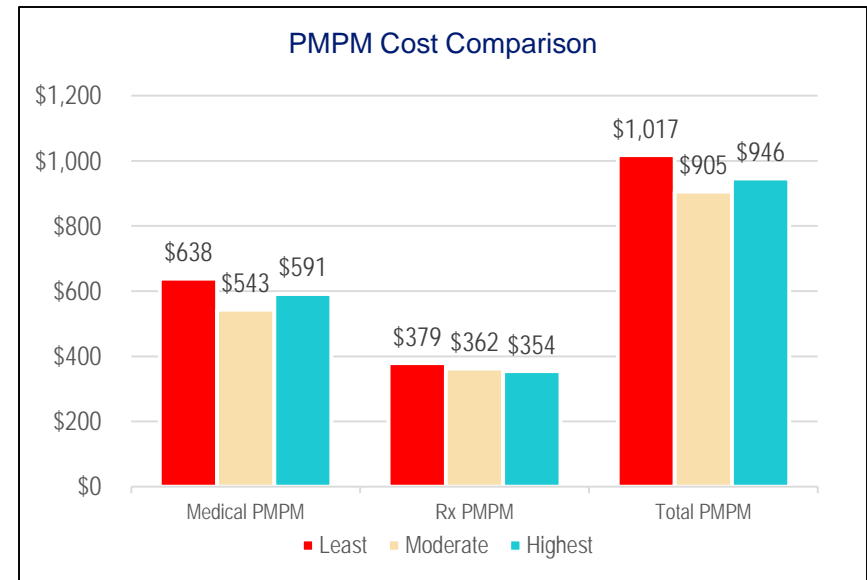

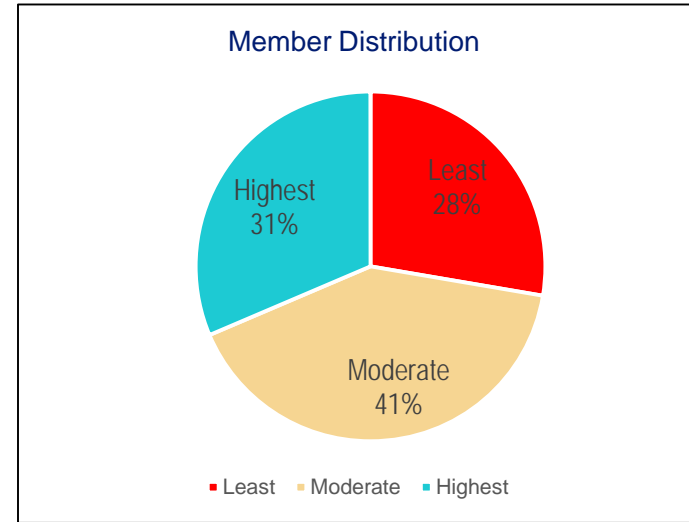

1. Consider a prevention program related to early interventions for physical therapy and weight loss
2. Direct contracting through bundled payments can be established independent of a carriers network for high volume high cost procedures
3. Established vendor partnerships exist within different carriers and independent vendors can offer virtual physical therapy or a separate network

² Reflects the ratio of PMPM costs of members with the specific level to the overall PMPM of diabetic members.

Key Takeaways From Obesity/Diabetes Review

1. Diabetes Prevention
 - a. Add a CDC approved Diabetes Prevention Program (DPP) through a digital platform
 - b. Incentive enrollment and key millstones
2. Diabetes Management
 - a. Add a digital management program that reduces the out of pocket cost to the member and increases compliance with prescribed treatment
3. Risk Reduction
 - a. Add a digital diabetes program that focuses on does optimization with lifestyle changes reducing independence on high cost injectable insulin
4. Establish quantifiable performance guarantees tied to individual health outcomes
 - a. A pilot can be focused on the highest cost diabetics

Appendix

Preventive Screening Metrics

The table below illustrates the restrictions applied when defining population that is applicable for each disease condition.

| Disease Condition | Age/Gender Restrictions | Notes |
|-------------------|-------------------------|--|
| Skin cancer | Not Applicable | The U.S. Preventive Services Task Force (USPSTF) has concluded there is not enough evidence to recommend for or against routine screening (total body examination by a doctor) to find skin cancers early (https://www.cdc.gov/cancer/skin/basic_info/screening.htm). |
| Breast cancer | Female, age 40-69 | |
| Colon cancer | All genders, age 50-75 | |
| Prostate cancer | Male, age 50-75 | |
| Lung cancer | Not Available | Unable to compute preventive screening metrics due to lack of smoking members identifier and tobacco consumption volume. |

About the Area Deprivation Index (ADI)

The Area Deprivation Index (ADI) is based on a measure created by the Health Resources & Services Administration (HRSA) over three decades ago, and has since been refined, adapted, and validated to the Census Block Group neighborhood level by Amy Kind, MD, PhD and her research team at the University of Wisconsin-Madison. It allows for rankings of neighborhoods by socioeconomic disadvantage in a region of interest (e.g. at the state or national level). It includes factors for the theoretical domains of income, education, employment, and housing quality. It can be used to inform health delivery and policy, especially for the most disadvantaged neighborhood groups.

<https://www.neighborhoodatlas.medicine.wisc.edu/>

What do the ADI values mean?

The ADIs on this website are provided in national percentile rankings at the block group level from 1 to 100. The percentiles are constructed by ranking the ADI from low to high for the nation and grouping the block groups/neighborhoods into bins corresponding to each 1% range of the ADI. Group 1 is the lowest ADI and group 100 is the highest ADI. A block group with a ranking of 1 indicates the lowest level of "disadvantage" within the nation and an ADI with a ranking of 100 indicates the highest level of "disadvantage".

Similarly, ADIs are also available in deciles from 1 to 10 for each individual state. The state deciles are constructed by ranking the ADI from low to high for each state alone without consideration of national ADIs. Again, group 1 is the lowest ADI (least disadvantaged) and 10 is the highest ADI (most disadvantaged).

Appendix

What methodology was used to create these ADI datasets?

The following two articles explain the methodology that was used to create these ADI datasets:

- Singh GK. Am J Public Health 2003;93(7):1137-43. [Area deprivation and widening inequalities in US mortality, 1969-1998](#)
- Kind AJH, Jencks S, Brock J, et al. Ann Intern Med 2014;161(11):765-74. [Neighborhood socioeconomic disadvantage and 30-day rehospitalizations: an analysis of Medicare data](#)

Data Assumptions

The analysis using ADI is dependent on having enrollment data that shows member data down to the granular census block zip code (9-digit zip code). The State's enrollment data received only included 5-digit zip code and therefore assumption on ADI scores had to be made.

In the cases where more than one ADI score was available when grouping the census blocks into a single 5-digit zip code, a weighted average ADI score was assigned based on the number of census blocks present within the group (see example below)

Examples below are for illustration only and not actual values

Example 1: all census blocks within the 5-digit zip code with identical score

| 5-digit Zip Code | Census Block | ADI Score |
|------------------|--------------|-----------|
| 12345 | G123450030 | 8 |
| 12345 | G123450031 | 8 |
| Average ADI | | 8 |

Example 2: Census blocks within the 5-digit zip code with different scores

| 5-digit Zip Code | Census Block | ADI Score |
|------------------|--------------|-----------|
| 12345 | G123450030 | 8 |
| 12345 | G123450031 | 7 |
| 12345 | G123450031 | 1 |
| Average ADI | | 5 |
